About SHERS

- A complete web based application that allows immediate on-line access to authorised users within an organisation, to report on actual or potential incidents.
- Allows incident monitoring, controls investigation including the specification and responsibility of required actions.
- Provides data and graphical analysis of all or cross sections of incidents.

Designed and written to combine the strengths and security of the IBM AS400 and i-series architecture with Internet technology to give an advanced application, a complete solution, that can help you.

In every organisation across all business sectors and all activity types, one main issue has in recent years become more important than ever before: the control and importance that must be placed upon Safety, Health and Environmental incidents. **All organisations must legally respond and report major incidents.**

And today more than ever before in the UK organisations are finding that incidents to both employees and customers are likely to result in an Insurance claim. The cost of investigation, correction and claims cannot be ignored.

All organisations want their employees and customers to be safe and healthy and to provide a clean environment. SHERS gives organisations the tools to do so.

SHERS ability to be able to report, respond and act is paramount if an organisation is going to effectively, control and ultimately diminish incidents and risks. SHERS facilitates smooth communication and automatic information flow, resulting in minimised response cycle times.

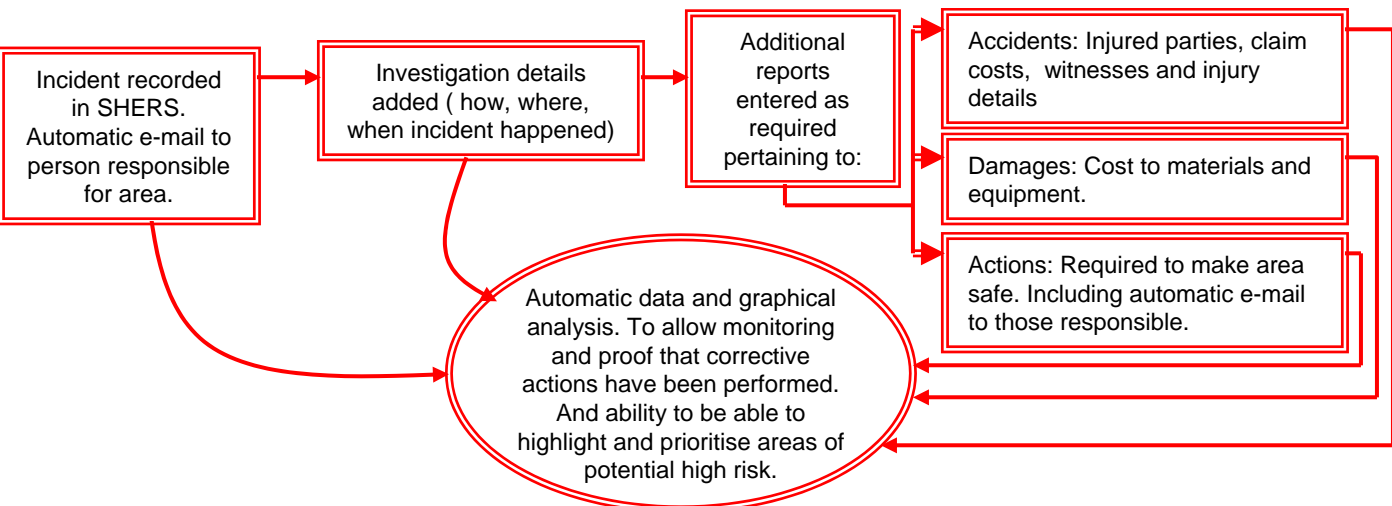

How SHERS Works

Organisations mould SHERS to their own specific unique requirements, via a set of clear and easy-to-use parameters.

Authorised users enter incidents, categorised and defined by the parameters.

SHERS automatically sends e-mails to the relevant personnel, immediately enabling rapid response and ensuring early awareness. Early investigation will always aid in fact finding.

Once on the system, incidents can be controlled, investigated and monitored, building data that is then automatically analysed and reported both statistically and graphically. This will ultimately lead to a reduction of incidents and costs relating to such incidents.

Automatic analysis allows you to determine Risk Management and plan safety improvements, showing where to concentrate resources most effectively, giving a return on investment and improvements in safety, health and environmental issues.
