

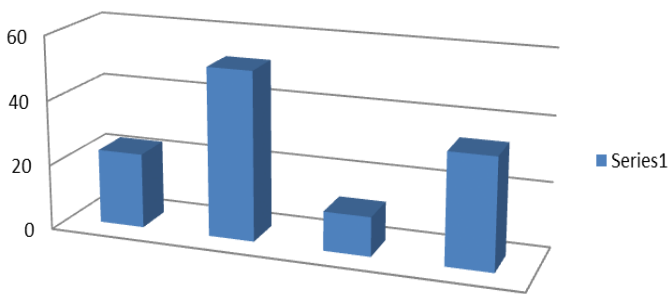

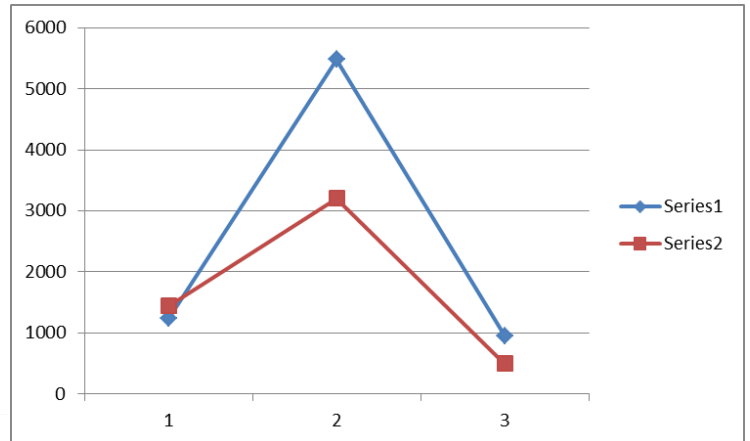

Charting for System i ... sophisticated graphical reporting directly within your System i

Generate Pie,
Line and Bar
charts from
RPG or CL

A picture paints a thousand words, so shouldn't your reports be more visual? Charting for IBM Power i allows your report generating workflow to include

graphical pie, line or bar charts, greatly increasing impact with both management and customers.

Easy Integration

Charting ships with examples written in RPG program which interfaces with the Charting Service.

Data is sent in, and the service writes images (JPEG and GIF are supported) to the IFS

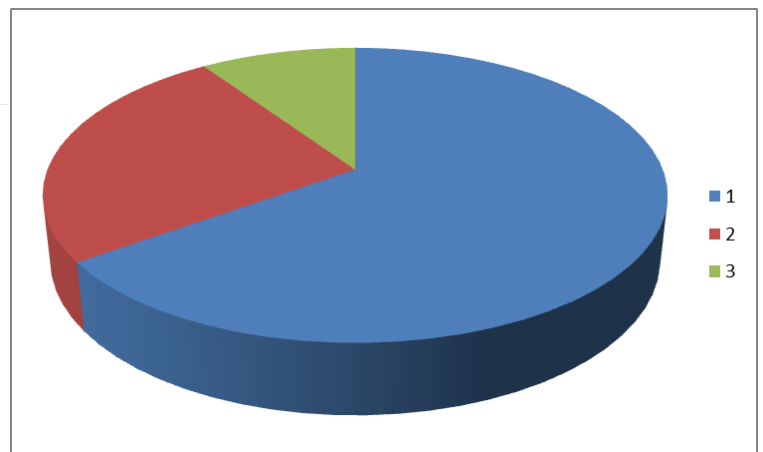

Before Charting

Print files, screen specifications, this is how we used to create reports. The world has moved on, we now live with colour laser printers, PDF reports etc. Your Business may function perfectly 24/7 on your IBM Power i, but the time has come to create modern professional reports, and leave the text-only world behind.

Three Chart Types

Charting supports 3 basic types of charts, pie, bar and line charts. The product is very configurable, you can choose where to position legends, the colours, fonts and font-sizes to use, whether to include pseudo-3D effects etc.

Of course you supply the chart data as well!

InterForm 400

You can go further. Charting seamlessly integrates with InterForm400 to provide an end-to-end reporting solution. Generate your PDF reports including as much graphical data as you wish, you'll be amazed with the results.
